

## class Adopter

An objects that stores important information about a potential pet adopter.

---

### `__init__(preferences)`

Initializes the specific `Adopter` instance with their preferences.

---

`preferences`  
(`list[int]`)

A list of pet indexes in preference order: n-1 index is nth preference.

---

**Raises**

`TypeError` if the inputted `preferences` object is not a list of integers.

---

```
Adopter([1st preference, 2nd preference, ..., nth preference])
```

---

### `get_preferences()`

Returns the `preferences` of the `Adopter` object.

---

**Returns**

A copy of the adopter's `preferences`: a list of integers representing pets with the 0th element being the favorite pet.

---

### `top_npreferences(n)`

Returns the n favorite pets of the `Adopter` object.

---

`n (int)`

an integer value that determines the top n pet preferences to be returned.  $0 \leq n \leq \text{len}(\text{preferences})$ .

---

**Returns**

A sublist of the adopter's `preferences`: a list of integers representing pets with the 0th element being the favorite pet up to the n-1 position being the nth preference.

---

**Raises**

`IndexError` if `n` is out of range.

---

**Calls**

`get_preferences()` to sub-divide the Adopter's preferences based on `n`.

---
